E-mail: difatsanaf@gmail.com & darmawan@uin-suka.ac.id

Abstract. This study aims to understand the value of Islamic public bank companies registered at OJK during 2013-2017. The used approach is the capital structure theory of MM preposition and David Durand. The used analytical method in this study is panel data regression analysis with the Random Effect Model. The results of the study show that the tax rate, profitability, and cost of capital affect the value of Islamic commercial bank companies simultaneously. Partially, tax rates and profitability affect the value of Islamic commercial bank companies. Cost of capital does not affect the value of Islamic commercial bank companies. This study succeeded in proving that in companies based on institutional ownership, especially Islamic commercial banks, the prevailing MM preposition capital structure theory is MM prepositions without tax. This study also succeeded in proving that the theory of David Durand's capital structure was proven. The cost of capital variables become influential when the company is divided into two based on institutional ownership.

Keywords. Corporate Values, Capital Structure Theory

INTRODUCTION

The dominance of the sharia banking sector in the Indonesian financial system is reflected in the magnitude of banking assets that are far greater than the assets of other financial institutions. The Financial Services Authority (OJK) published that currently Islamic banking controls Indonesia's financial assets by (72%). The assets of other financial institutions are still far below banking assets such as Islamic insurance (2%), Syariah IKNB (6%), sukuk (16%), and Sharia Mutual Funds (4%).

Given the importance of the function and role of Islamic banking in Indonesia, the Islamic banking sector needs to improve its performance in order to create a clean and efficient banking system with Islamic principles. In order to find out the success of a Bank's performance, it can be seen that its financial performance is reflected in the published financial statements. One of them can be seen from the value of the company.

Company value describes as the investor's perception of the company, which is often associated with stock prices, as the current stock price reflects investors' assessment of the company in the future. If the company makes a bad decision, the stock price will go down. Therefore, the aim of management is to make decisions that can increase stock prices, because this will generate wealth for shareholders, thus increasing the value of the company (Brigham and Houston, 2006). Yet, in this study, company value is proxied by book value as some Islamic commercial banks have not made Initial Public Offerings (IPOs). Thus, according to a book by Hermanson (1987), value can be calculated using total assets minus liabilities (debt).

Corporate value is influenced by tax rates, supported by MM's theory with taxes (1958), which states that by including corporate income tax, the use of debt will increase the value of the company. This is also in accordance with the research by Lawi (2016) which explains the level of debt and tax benefits of a bank having a positive relationship. Therefore, Islamic commercial banks have the motivation to reduce the tax that must be paid, namely by increasing debt.

In addition, the success of a bank's performance can be seen from its ability to earn profits, or commonly called profitability. Profitability is one of the important indicators in measuring the performance of a bank. Good profitability will support the company's operations, and play a major role for stakeholders, such as the community, government, employees, creditors, and other parties that are
related to the company. Good profitability also supports the welfare of stakeholders and it will also be
guaranteed.

Profitability can be proxied by the ratio of Return on Assets (ROA). ROA focuses on the ability
of banks to earn profits in the overall operational process of the company. The level of bank
profitability is more often measured using ROA. According to Kasmir (2014) states the measure of
profitability used is Return On Equity (ROE) for companies in general, and Return On Assets (ROA)
in the banking industry.

According to the latest Islamic Banking Statistics from the Financial Services Authority (2017),
the Islamic banking industry already has a network of thirteen Islamic Commercial Banks (BUS), 34
Islamic Business Units (UUS), and 104 BPRS. Based on the Law No. 21 of 2008, Islamic Commercial
Banks are Islamic Banks which in their activities provide services in payment traffic. The following
graph depicts the data of the Islamic Commercial Bank ROA for the period 2013-2017.

![Figure 1: Profitability of Islamic Banking during 2013-2017](image)

According to Bank Indonesia Circular Letter No.9 / 24 / Dpbs in 2007, Bank Indonesia sets a
standard ROA of 1.5%. ROA that is above the standard criteria set by BI has a very high management
ability in terms of managing assets in increasing revenue and reducing costs.

Based on the diagram of the average profitability of Islamic commercial banks in Indonesia
during 2013-2017 contained in the Financial Services Authority Islamic banking statistics. It shows
that there was a sharp decline from 2013 to 2014. However, in 2014 to 2017 there was an increase.
The ups and downs of ROA are influenced by net profit margins and total assets turnover because if
low ROA is caused by low profit margins caused by low total assets turnover (Kasmir, 2014). There
are still some banks that have ROA that tend to be below the standard set by BI, which is below 1.5%.

Banks that have profitability below the standards set by Bank Indonesia and experience a
decline, it can be a problem for banks. This is as stipulated in Bank Indonesia Regulation No.9 / 1 /
PBI / 2007 that "Banks that violate the rules on bank soundness will be subject to administrative
sanctions including: written warning, suspension of business activities, recording of management or
shareholders in a banned list". Therefore, each bank must maintain and increase the profitability of its
business. Thus, it does not violate the stipulated rules and does not get sanctions.

Meanwhile, the level of cost of capital use that must be taken into account by the company is
the level of use of capital costs as a whole. Therefore, the costs of each source will be varied. Thus, in
order to determine the capital cost of the company as a whole needs to calculate the weighted average
cost of various sources of funds. The concept of capital costs is intended to be able to determine the
real cost of capital use of each source of funds and then determine the average cost or commonly
called the weighted average cost of capital (WACC) (Indra Setyawan, 2010).
Determination of different capital costs, of course, will produce different company values. Therefore, it is necessary to do an analysis to find out whether there is an influence between the cost of capital and the maximum company value. In the theory of Duran (1952) explains that companies have an optimal capital structure when the maximum firm value or capital structure makes the average cost of capital a minimum. In other words, the value of the company has increased to a certain point that there is an optimal capital structure and then decreases, so that it can be said that the cost of capital affects the value of the company. Based on the theory and research stated above, the cost of capital has an influence on the fluctuation of the value of the company.

According to the background of study above, the problem formulation can be drawn as follows: does tax, profitability and cost of capital affect the value of Islamic bank companies?

Based on some formulation of the problem and the purpose of the research, this research is expected to be able to provide the following benefits:

1) Academically
   This research is expected to be a reference material for further research as it is possible to have other variables that can affect the value of Islamic commercial bank companies.

2) Islamic Commercial Banks
   It is expected that the results of this study can be used as a consideration for Islamic Commercial Banks in making decisions on policies related to financial issues including funding. This research can also be used as input in improving the financial performance of Islamic Commercial Banks, in order to continue in surviving and competing in the banking industry with national and international conditions.

3) Community
   The results of this study hopefully can provide information on the condition of Islamic Commercial Banks in Indonesia, especially for third parties, as it can be used as input in making decisions when investing. The condition can be known early.

LITERATURE REVIEW
THEORETICAL FOUNDATION
a. Capital Structure Theory of MM Preposition

   Franco Modigliani and Merton H. Miller in his article entitled The Cost of Capital, Corporate Finance and Theory of Investment in 1958 give the assumption as follows:
   1. All physical assets are owned by the company.
   2. The capital market is without friction. There are no corporate or personal income taxes. Securities can be bought or sold at no cost and instantly, and there are no bankruptcy fees.
   3. Companies can only issue two types of security, risk of equity and risk of free debt.
   4. Both individuals and companies can borrow or lend at risk-free interest rates.
   5. Investors have homogeneous expectations towards the flow of company profits in the future.
   6. There is no growth, so all cash flow are eternal.
   7. All companies can be classified into one of several "equal return classes" so that the profits on the shares of all companies in the level are comparable to, and perfectly correlated with all other companies in the level (Megginson, 1997).

1) The MM Approach without Tax Theory
   Proposition I:
   Company value is a capitalization of net operating profit (EBIT / earning before interest and tax) or profit before interest and tax with a constant capitalization rate in accordance with the level of risk of the company. The value of companies that do not have debt is the same as the value of companies that have debt.
   This concept also argues that the company's capital structure does not affect the value of the company. In addition, the weighted average cost of capital equals the cost of equity.
   Proposition II:
In this proposition MM-Theory argues that the cost of equity for companies that have debt is the result of the amount of equity costs for companies that do not have debt. It pays company risk in certain level with the risk of the size of the company depending on the difference between costs equity and cost of debt and the amount of the used debt.

Preposition III:
In this preposition, MM-Theory discusses the new investments made will increase the value of the company. That is, the value of the company must increase at a minimum by the value of the project investment.

All propositions proposed by MM-Theory clearly state that the value of a company does not depend on the capital structure of the company.

2) Theory of MM’s Approach to Tax

Preposition I:
The value of a company that has a debt will increase as much as the saved tax (Tax-Shield).

Preposition II:
Corporate equity costs that have debt will increase as much as debt which is used but the cost of equity is less than the cost of equity with no tax. It means that the tax gives a reduction effect on the cost of company equity. Taxes provide savings to companies in increasing company value.

Preposition III:
In this preposition, MM-theory suggests that the carried out internal rate of return of an investment project must be greater than the cost of equity minus the tax portion at the cost of equity use of funds.

b. David Durand Capital Structure Theory

Financial structure theory is associated with the value of the company firstly developed by David Duran in 1952 in his article entitled "Cost of Debt and Equity Funds for Business: Trend and Problems of Measurement". Duran assumes that corporate tax is zero. Furthermore, the value of the company can be seen with three approaches.

The first approach, namely the Net Profit Approach. In this approach, the cost of equity and the cost of debt are considered constant so that the company can increase debt. If to and kd are constant, the greater the amount of debt used, the WACC (ko) is smaller because kd is always lower than to. The value of the company increases when using more debt.

The second approach, namely the Net Operating Income Approach. In this approach, investors have different reactions to companies that experience a lot of debt. The cost of debt is constant. But the greater use of debt is seen by the owners of their own capital as an increase in the risk of the company thus increasing the cost of equity. Consequently, WACC has not changed and capital structure decisions have become insignificant.

The third approach is the traditional approach. The company has an optimal capital structure when the maximum corporate value or capital structure makes the average cost of capital a minimum. This event can occur because it is assumed that the risk of the company does not experience changes to a certain capital structure or certain leverage. The WACC will initially go down and after a certain leverage level will rise. In other words, the value of the company has increased to a certain point there is an optimal capital structure and then decreases.

According to David Durand, the approach is the opposite of the net income approach with no tax. In this approach, the WACC remains constant, this postulates that the market analyses the entire company and the discount has nothing to do with the debt / equity ratio. If tax information is provided, it states that the WACC reduces the increase in debt financing, and the value of the company will increase.

c. Profitability

The values of profitability are reflected in the following Qur'an, Al An'am: 141:

And He it is who causes gardens to grow, [both] trellised and untrellised, and palm trees and crops of different [kinds of] food and olives and pomegranates, similar and dissimilar. Eat of
Company profitability can be measured by various ratios. Yet, this study only uses the ratio of return on assets. Return on Assets is the ability of the average activity in generating earnings before tax. The magnitude of the results of this calculation shows how strong the company's ability in generating profits available to ordinary shareholders with all of their acquired assets. ROA can be calculated using the formula: ROA = (net profit before tax) / (Total Assets) X 100%.

PREVIOUS RESEARCHES

Hari Sulistyo (2017) conducted a research entitle Analysis of Capital Structure Against WACC and WACC Analysis of Company Values. The research objects are PT HM Sampoerna Tbk, PT Gudang Garam Tbk, and PT Bentoel Investama Tbk. The used research method in the research was a comparative descriptive method, with a population of all cigarette companies listed on the IDX, with three cigarette companies (PT HM Sampoerna Tbk, PT Gudang Garam Tbk, and PT Bentoel Investama Tbk). The data used are financial statement data for the period 2009-2013. The sampling technique is purposive sampling. Researched variables are stock price, DER, and WACC. The results of the study indicate that the proportion of capital structure (DER) has an influence on the WACC. In addition, the proportion of WACC has an influence on company value which is proxied by the stock price.

Ayu Sri Mahatma Dewi and Ary Wirajaya (2013) conducted a research entitle The Influence of Capital Structure, Profitability and Company Size on Firm Value. The object of research was in manufacturing companies on the IDX. The method in determining the sample is purposive sampling. 71 manufacturing companies met the criteria. The population in this study is a manufacturing company on the stock exchange in 2009-2011. This study uses multiple linear regression analysis. The results of the study concluded that 1) the capital structure has a negative and significant effect on firm value, 2) profitability has a positive and significant effect on firm value, 3) the size of the company does not affect the firm's value.

Muhammad Shadap Abdul Sattar (2015) researched a topic and title his research with Cost of Capital - The Effect to the Firm Value And Profitability; Empirical Evidences in Case of the Textile Sector of KSE 100 Index. The research objects are textile sector: Nishat Mills Limited, Kohinoor Textile Mills Limited, Colgate Palmolive (Pakistan) Limited, Bata Pakistan Limited. This study uses panel data regression analysis. The results of the study indicate that there is a significant impact from the Weighted Average Capital Cost of the Company and Asset Returns. There is a positive influence between Company Size and Asset Returns if any changes occur in the Independent Variable except for one variable, namely WACC. WACC has a negative impact on Company Value and Asset Returns. Furthermore, any changes in the WACC can affect the return of company assets.

Thinking Framework

![Thinking Framework Diagram](image)

**Figure 2**
Thinking Framework
Hypothesis

Based on the analysis of the theory and previous research, the research hypothesis can be drawn as follows:

1) Effect of Tax Levels on Corporate Values of Islamic Commercial Banks

Based on MM’s theory with taxes (1958) states that by including corporate income tax, the use of debt will increase the value of the company. In conditions of income tax, companies that have leverage will have higher value compared to companies without leverage. The increase in the value of the company occurs as an effect of interest payment on debt is a tax deduction. Therefore, the operating profit that flows to investors is getting bigger.

2) Influence of Profitability on Corporate Values of Sharia Commercial Banks

The Theory of capital structure from Modigliani Miller's approach without tax (1958) states that company value is a capitalization of net operating profit (EBIT) or profit before interest and tax with a constant capitalization rate (ko) in accordance with the company level of risk. The concept means that company value is influenced by profitability. The following statement is supported by Signaling Theory, Bhattacarya (1979) which explains that high profitability shows good company prospects so that investors will respond positively and the value of the company will increase.

3) Effect of Cost of Capital on Corporate Values of Islamic Commercial Banks

Duran, 1952 explains that the company has an optimal capital structure when the maximum company value or capital structure makes the average cost of capital a minimum.

Hypothesis can be taken from the explanation above as follows:

1. H0: Variables X1, X2, X3 affect Y
   H1: Variables X1, X2, X3 do not affect Y
2. H0: Variable X2, X3 affects Y
   H1: Variable X2, X3 does not affect Y

RESEARCH METHODS

In this study, the data used is included in the secondary data type. Secondary data in this research are data in the form of numbers presented and published in financial statements that can be accessed in the web of Islamic Commercial Bank companies during the year of 2013-2017.

The research sample used purposive sampling method to get a representative sample with the specified criteria. The research will use only eleven Sharia Commercial Banks as the research sample. The used method in this study is a data panel regression analysis model. In the analysis of panel data models, there are three approaches used in estimating panel data regression models, namely Common Effect Model, Fixed Effect Model, and Random Effect Model.

DISCUSSION

During 2013-2017, the Financial Services Authority (OJK) had twelve Islamic Commercial Banks. After a purposive sampling method, there was a sample of eleven Islamic banks based on ownership consisting of seven private banks and four state-owned banks. Then, 55 financial statements were obtained, these data include large data types and have met the minimum amount of data to be studied.

Prob(F-statistic): 0.001180

The regression results in Table 2 can be written as follows:

\[ \text{Ln Company Value} = 14.6760 + 1.9437X_1 + 0.1017X_2 - 0.0040X_3 \]

Hypothesis testing was done through 3 kind of tests:

**Table 3 F-Statistic Test Result**

| F-statistic | 6.158467 |
| Prob(F-statistic) | 0.001180 |

Table 3 shows F-statistics of 6.15 with a probability of 0.0011. Probability of 0.0011 is less than \( \alpha \) (0.05) which means that all independent variables together \( X_1, X_2, X_3 \) can affect the dependent variable \( \text{Company Value} \).

**Table 4 Results of the Determination Coefficient \( (R^2) \)**

| R-squared | 0.265927 |
| Adjusted R-squared | 0.222746 |

Table 4 shows the coefficient of determination \( \text{(Adj. } R^2) \) of 0.2227. The following condition means that the independent variable can explain the dependent variable by 22.27% while the remaining 77.73% is explained by other variables which is not included in the research.

<td>2.348475</td>
<td>0.0228</td>
</tr>
</tbody>
</table>

Table 5 used a 95% confidence level ($\alpha = 0.05$) and result as follows:

a. The tax rate ratio ($X_1$) has a regression coefficient of 1.9437 and the t-value of statistics of 2.3484 with a probability of 0.0228. The probability value is smaller than $\alpha$ (0.0228 <0.05). It means that the tax rate variable partially has a significant positive effect on the value of Islamic commercial bank companies.

b. Profitability ratio ($X_2$) has a regression coefficient of 0.1017 and the t value of statistics is 2.3442 with a probability of 0.0230. The probability value is smaller than $\alpha$ (0.0230 <0.05). It means that the profitability ratio variable partially has a significant positive effect on the value of Islamic commercial bank companies.

c. The ratio of cost of capital ($X_3$) has a regression coefficient of -0.0040 and a statistical t value of -0.0677 with a probability of 0.9463. If the probability value greater than $\alpha$ (0.9463> 0.05) means that the variable cost of capital ratio partially has no effect on the value of Islamic commercial bank companies.

Thus, the tax rate and profitability variables partially have a significant effect on the value of Islamic commercial bank companies in 2013-2017. Other variables show differently. The cost of capital partially does not affect the value of Islamic commercial bank companies in 2013-2017.

2) Effect of Profitability and Cost of Capital on Corporate Values of Islamic Commercial Banks

Panel data was tested by testing panel data with a random effect model to determine the effect of profitability and cost of capital on the value of Islamic commercial bank companies in 2013-2017.

<td>0.0009</td>
</tr>
</tbody>
</table>

Table 4.9, using a 95% confidence level (\( \alpha = 0.05 \)) shows the results as follows:

a. Profitability ratio (X2) has a regression coefficient of 0.1464 and a t-value of statistics of 3.5338. The probability value is smaller than \( \alpha \) (0.0009 <0.05), whereas the profitability ratio variable partially has a significant positive effect on the value of Islamic commercial bank companies.

b. The ratio of cost of capital (X3) has a regression coefficient of -0.0317 and a statistical t value of -0.5052 with a probability of 0.6515. The probability value is greater than \( \alpha \) (0.6515> 0.05). It means that the cost of capital variable partially does not affect the value of Islamic commercial bank companies.

It could be concluded that profitability variables partially have a significant effect on the value of Islamic commercial bank companies in 2013-2017. While the cost of capital variable partially does not affect the value of Islamic commercial bank companies in 2013-2017.

Based on the results of panel analysis of random effect models, the tax rate variable has a significant positive effect on the value of Islamic commercial bank companies. This is because the
regression coefficient value is 1.9437 and the t value of statistics is 2.3484 with a probability of 0.0228. The probability value is smaller than $\alpha$ (0.0228 < 0.05). It means that the tax rate variable partially has a significant positive effect on the value of Islamic commercial bank companies.

This is in line with MM's theory with taxes (1958) stating that by including corporate income tax, the use of debt will increase the value of the company. In conditions of income tax, companies that have leverage will have higher value compared to companies without leverage. The increase in the value of the company occurs because the interest payment on debt is a tax deduction, therefore the operating profit that flows to investors is getting bigger. So the hypothesis is accepted.

Profitability is one of the important indicators in measuring the performance of a bank. Good profitability can support the company's operations. Profitability can be proxied by ROA (Return On Asset).

Based on the results of the panel random effect model data analysis, the variable profitability ratio has a significant positive effect on the value of Islamic commercial bank companies. It happens as the obtained regression coefficient value is 0.1017 and the t value of statistics is 2.3442 with a probability of 0.0230 and the probability value is smaller than $\alpha$ (0.0230 < 0.05). The average profitability ratio of sharia commercial banks during 2013-2017 was -0.2012 or -20.12%. This average yield is still below the standard set by Bank Indonesia, which is 1.5%.

The results of this test are in accordance with the second hypothesis which states that the profitability ratio has a significant positive effect towards the value of Islamic commercial bank companies. If probability is high, it can provide a positive signal for investors that the company produces in favorable conditions. This is an attraction for investors to own company shares. Thus, increasing the value of the company.

The cost of capital represents the actual costs which are incurred by the company to obtain funding. The funding source itself can come from 2 types of sources, namely equity in the form of ordinary shares, preferred stock, and retained earnings. While the second source of funding, namely Debt or long-term debt.

Based on the results of panel analysis of random effect model, the variable cost of capital does not affect the value of Islamic commercial bank companies. It happens as the regression coefficient value is -0.0040 and the statistical t value is -0.0677 with a probability of 0.9463. The probability value is greater than $\alpha$ (0.9463 > 0.05).

Based on the theory (Duran, 1952) which explains that the company has an optimal capital structure when the maximum company value or capital structure makes the average cost of capital a minimum.

The following condition can be explained as if the WACC is high, the equity payment is also high. A high WACC requires companies to be careful in investing, as it will demand high returns. The lower the WACC value, the better for the company, as the company's responsibility provides low returns to shareholders.

Yet, this study found that institutional ownership affects the cost of capital or the value of company of Islamic commercial bank companies. This is proven when separating banks based on institutional ownership, namely government-owned Islamic public banks and private-owned Islamic public banks. The following is a test table for the results of $R^2$ of government-owned and private-owned Islamic commercial banks.

Based on the testing table, the R² results are obtained that R² of the state-owned Islamic banks R² is 0.3338 or 33.38% affects the value of the company, while the R² of the state-owned Islamic banks is 0.2484 or 24.84% affects the value of the company. This is supported by research (Tendi, 2007) that the number of large shareholders has an important meaning in monitoring managerial behavior in the company. The presence of institutional ownership will be able to monitor the management team effectively and can increase the value of the company.

While according to research (Lestari, 2017) concluded that, institutional ownership managed to increase company value, this shows that the control function of the owner is very decisive in improving the performance of the company. According to Barnae and Rubin (2005) the greater the institutional ownership, the stronger the control of the company. Thus, the owner of the company can control the behaviour of management in order to act in accordance with the objectives of the company which will ultimately increase the value of the company.

This study has successfully proved that in companies, especially Islamic commercial banks, the prevailing preposition MM capital structure theory is MM without Tax preposition. It was caused as taxes have no effect when the company is examined based on institutional ownership. This study also succeeded in proving that David Durand's capital structure theory was proven, the Cost of Capital variable became influential when the company was divided into two based on institutional ownership. The condition proves that institutional ownership affects the Cost of Capital or not affects the value of Islamic commercial bank companies.

**CLOSING**

**Conclusions**

Based on the previous described analysis and the factors that influence the value of the Islamic commercial bank company, the conclusions are as follows:

1) Variable tax rates, profitability, and cost of capital simultaneously influence the value of Islamic commercial bank companies. Yet, the cost of capital does not partially affect the value of Islamic commercial bank companies.

2) Variable profitability and cost of capital simultaneously influence the value of Islamic commercial bank companies. Yet, the cost of capital does not partially affect the value of Islamic commercial bank companies.

3) Both models in this study show that the cost of capital partially do not affect the value of Islamic commercial bank companies. The study found that institutional ownership also affected the value of Islamic commercial bank companies. The greater the institutional ownership, the stronger the control of the company, so that the owner of the company can control the behaviour of management to act in accordance with the objectives of the company which will ultimately increase the value of the company.

**Suggestions**

Based on the analysis of the factors described in previous chapter that influence the value of Islamic commercial bank companies, the authors provide advices to the company, the community as customers and to the next researcher as follows:

1) Islamic commercial banks companies need to improve the quality and quality of Islamic banking products, so that people are more interested in using products from Islamic commercial banks.
2) People who, in this matter as customers, are expected to be more aware of the advantages and advantages of Islamic banking compared to conventional banking and immediately switch to Islamic banking.

3) Further researchers are expected to be able to add institutional ownership variables, or make the institutional ownership variable as a moderating variable that may affect the value of Islamic commercial bank companies.
